

The Aquasana Drinking Water Enhancement System

Ultra high quality drinking water at the convenience of tap water for only cents per litre

This product represents a new era in home water treatment. Independent laboratory tests have documented this system's ability to reduce contaminants more effectively and economically than other home water systems.

Contaminant reduction claims have been evaluated and certified by the California Department of Health Services for accuracy. (certificate available on request)

Aquasana's twin cartridge, multi-stage filtration process uses a combination of the most effective technologies available, mechanical filtration, adsorption and ion exchange.

This patented process selectively filters out specific contaminants while allowing the natural minerals to remain, creating the healthiest, best tasting water possible.

The "A" cartridge.... Filters out sediment and, tiny microscopic particles that can cause cloudiness and unpleasant taste and odour in water.

The "A" cartridge also filters out chlorine, the most concentrated and the most competitive chemical in our water. This allows the following stages in cartridge "B" To focus on the more difficult contaminants like lead and volatile organic chemicals. (VOC's).

The "B" cartridge Is where the final stages of filtration take place. Lead is filtered out by a complex ion exchange process where lead ions are replaced with potassium ions. This process is highly effective for lead reduction and also enhances the natural mineral balance of water. Potassium is one of the minerals that give water a natural spring water taste and a neutral pH.

Next is the most challenging and possibly the most important stage, the adsorption of volatile organic chemicals, like herbicides, pesticides and industrial solvents. (performance data sheet for specific claims available).

The "B" cartridge is also a 0.5 micron mechanical filter effective for chlorine resistant organisms like cryptosporidium and giardia, two common water borne parasites that can cause flu like symptoms for most, but can also be fatal to small children and the elderly.

The result is a refreshing, great tasting, healthy supply of drinking water at the convenience of your own kitchen faucet

The AQ-4000 system can also be installed under the counter with an under-sink conversion kit. Requires purchase of AQ-4000 plus conversion kit

Under-sink conversion kit with economy tap

Filter cartridges last for 1900 L and should be replaced every 6 months

Deluxe tap option
